

90-Minute Focus Sprint

A compact one-page routine for turning a vague task into measurable progress.

1. Define the finish line

Write one sentence describing what must exist at the end of the sprint. Avoid goals such as “work on project.” Prefer “finish login validation and test three edge cases.”

2. Remove friction

Close unrelated tabs, silence notifications, prepare water, and open only the files or tools required for the task.

3. Work in three blocks

Use 25 minutes of focused work, 5 minutes away from the screen, then repeat three times. Do not use the break to start a new digital distraction.

4. Keep a parking lot

If a new idea appears, write it down in one line and return immediately to the current task.

5. End with evidence

Before stopping, record what changed: a commit, completed exercise, solved bug, written page, or other observable output.

Quick scorecard

Question	Yes / No
Did I define one concrete outcome?	
Did I avoid context switching?	
Did I produce visible evidence of progress?	
Do I know the next action?
